Experiment 9: Index of First Occurrence in a String

Aim : To find the index of the first occurrence of a substring in a given string.

Algorithm

1. Read the main string and the substring to search for.
2. Compare the substring with each possible position in the main string.
3. If a match is found, return its starting index.
4. If no match is found, return -1.
5. Display the result.

Python Program

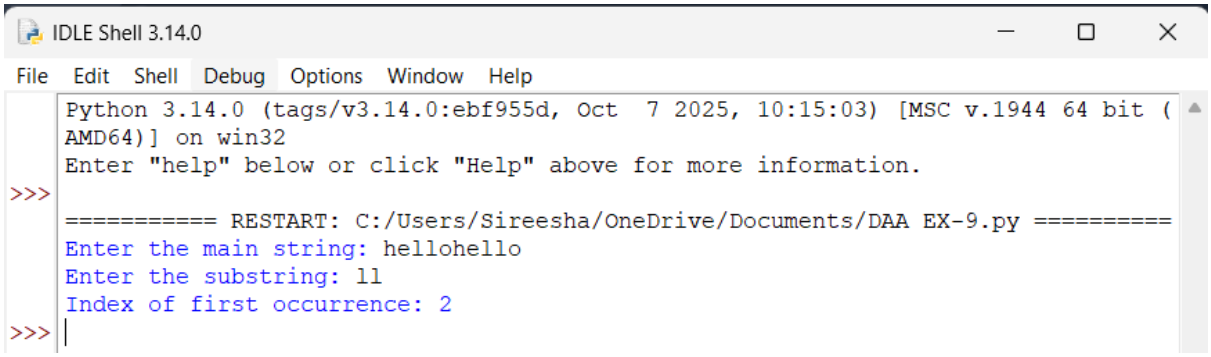

```
text = input("Enter the main string: ")
pattern = input("Enter the substring: ")
index = -1
for i in range(len(text) - len(pattern) + 1):
    if text[i:i + len(pattern)] == pattern:
        index = i
        break
print("Index of first occurrence:", index)
```

Input

Enter the main string: hellohello

Enter the substring: ll

Output

Result

Thus, the Python program to find the index of the first occurrence of a substring was successfully executed.
